

AQUAGRID.

A Net for Farming, not Fishing.

1

Semi-rigid structure has superior strength (as much as 100% more than conventional nylon netting).

2

This tough polyester AQUAGRID fiber makes it almost impossible for predators like seals and sea lions to bite through.

3

Fabrication is simple, either by hand or high pressure air welding.

4

Tight fiber bundling improves water flow. Coating resists UV degradation.

5

The smooth surface reduces the number of biofouling attachment points. Cleaning is easier, and less frequent.

Introducing AQUAGRID™, the first aquaculture net designed specifically for farm fish containment. This new semi-rigid design provides the durability, protection, and structural strength that conventional nets can't. It's up to 100% stronger.*

Better yet, your investment in AQUAGRID pays off with less maintenance, longer life, simple installation, easier cleaning, and lower cost per pound.
